

INTERNSHIP REPORT

GenAI Powered Data Analytics Job Simulation

Prepared by

Satya Ranjan Dhal

Internship / Job Simulation Period: September 2026

Certificate of Completion: 8 September 2026

This report presents the learning activities, practical tasks, methods, outcomes, and reflections associated with the GenAI Powered Data Analytics Job Simulation completed during September 2026.

Source: Certificate of Completion issued by Forage. The certificate records practical work in exploratory data analysis and risk profiling, predicting delinquency with AI, business reporting and data storytelling for collections strategy, and implementing an AI-driven collections strategy.

CERTIFICATE & INTERNSHIP OVERVIEW

The uploaded certificate identifies Satya Ranjan Dhal as the participant who completed the “GenAI Powered Data Analytics Job Simulation.” It states that the practical tasks were completed over September 2026 and records the certificate date as 8 September 2026. [\[filecite\turn0file0\L2-L6\]](#)

The certificate specifically lists four areas of practical activity: exploratory data analysis and risk profiling; predicting delinquency with AI; preparing a business report and using data storytelling for collections strategy; and implementing an AI-driven collections strategy. [\[filecite\turn0file0\L6-L10\]](#)

About the simulation

A job simulation is a practical learning format in which a learner works through tasks designed to resemble professional activities. In this report, the term “internship” is used in the sense of the completed job simulation documented by the certificate. No separate employer, office location, stipend, duration in hours, or supervisor details are stated on the uploaded certificate, so those details are not assumed here.

Certificate issuer

The certificate identifies Forage as the issuing organization and names Tom Brunskill, Co-Founder of Forage. [\[filecite\turn0file0\L11-L13\]](#)

Internship focus

- Applied data analytics and exploratory analysis.
- Risk profiling using data-driven reasoning.
- AI-assisted prediction of delinquency.
- Business reporting and data storytelling.
- Design and implementation thinking for AI-driven collections strategy.

DECLARATION

I hereby present this internship report as a record of my learning and practical work associated with the GenAI Powered Data Analytics Job Simulation completed during September 2026. The report has been prepared using the information available in my Certificate of Completion and organizes the activities into a structured academic report.

The purpose of this report is to document the major areas covered during the simulation, explain the relevance of each activity, describe the analytical workflow in clear terms, and reflect on the skills developed through the experience.

Where the uploaded certificate does not provide a specific technical implementation detail, this report describes the corresponding concept or professional workflow at an explanatory level rather than presenting unsupported details as completed work.

Student

Satya Ranjan Dhal

Report title

GenAI Powered Data Analytics Job Simulation — Internship Report

Period

September 2026

Certificate date

8 September 2026

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone and every learning platform involved in making this practical learning experience possible. The GenAI Powered Data Analytics Job Simulation provided an opportunity to understand how data analytics and artificial intelligence can be connected with business decision-making.

I am thankful to Forage for providing the simulation and issuing the Certificate of Completion. The certificate confirms completion of practical tasks during September 2026 and records the major areas covered in the experience. `filecite\turn0file0\L5-L13`

I also acknowledge the importance of the practical tasks themselves. Working through exploratory data analysis, risk profiling, AI-based delinquency prediction, business reporting, data storytelling, and an AI-driven collections strategy creates a useful connection between classroom concepts and professional analytics workflows.

Finally, I am grateful to my teachers, mentors, friends, and family for their encouragement and support toward developing technical and professional skills.

— Satya Ranjan Dhal

INTRODUCTION TO DATA ANALYTICS AND GENERATIVE AI

Data analytics is the process of examining data to discover useful patterns, relationships, trends, and insights that can support decisions. In a business setting, analytics helps transform raw records into information that managers can understand and act upon.

Generative AI (GenAI) refers to AI systems that can assist in producing or transforming content and can support analytical workflows through natural-language interaction. In a data analytics context, GenAI can be useful for explaining findings, assisting with report preparation, organizing insights, and supporting decision-making workflows when used responsibly.

The simulation covered a practical combination of analytics and AI-oriented activities. The certificate explicitly identifies exploratory data analysis and risk profiling, delinquency prediction with AI, business reporting and data storytelling for collections strategy, and implementation of an AI-driven collections strategy. [filecite\turn0file0\L6-L10]

Importance of the topic

- Data helps organizations understand customer and business behaviour.
- Risk profiling can help prioritize attention toward different levels of risk.
- Prediction can support proactive rather than purely reactive decision-making.
- Business reports convert technical analysis into information suitable for decision-makers.
- AI-driven strategies can help structure and scale analytical decision processes.

Overall workflow

A useful high-level workflow is: Data → Exploration → Risk/Predictive Analysis → Business Insight → Strategy → Implementation → Monitoring. Each stage builds on the previous one and helps connect technical analysis with business action.

EXPLORATORY DATA ANALYSIS AND RISK PROFILING

The first practical area listed on the certificate is exploratory data analysis (EDA) and risk profiling. [filecite\turn0file0\L6-L8]

Exploratory Data Analysis

EDA is the process of understanding a dataset before building predictive models or making business recommendations. It commonly involves checking the structure and quality of data, examining distributions, identifying unusual values, and looking for relationships among variables.

A clear EDA workflow can include:

- Understanding the available variables and their meanings.
- Checking missing or inconsistent values.
- Examining numerical and categorical variables.
- Studying distributions and unusual observations.
- Comparing important groups and identifying patterns.
- Summarizing findings in charts and tables.

Risk profiling

Risk profiling means organizing customers, cases, or observations according to indicators of risk. In a collections context, a risk profile can help distinguish customers who may require early attention from those who may need less intensive intervention.

The important analytical principle is that profiling should be evidence-based. Data should be examined carefully, and the resulting risk categories should be understandable to business users. A good profile is not simply a score; it should help explain what action may be appropriate.

Learning gained

This activity develops the ability to move from raw data toward structured business understanding. It also establishes the foundation for the later prediction and collections-strategy activities listed in the certificate.

PREDICTING DELINQUENCY WITH AI

The second practical area listed in the certificate is “Predicting delinquency with AI.”

Meaning of delinquency prediction

In a financial or collections context, delinquency prediction generally means estimating which accounts or customers may become overdue or otherwise require collections attention. The objective is to support earlier and more informed intervention.

Typical analytical pipeline

- Define the prediction objective clearly.
- Prepare and validate the input data.
- Select meaningful predictive features.
- Train an appropriate machine-learning or AI model.
- Evaluate predictions using suitable performance measures.
- Interpret results in business terms.
- Use predictions as decision support rather than as an unquestioned final decision.

Role of AI

AI can identify patterns across multiple variables that may be difficult to evaluate manually at scale. In a professional workflow, however, prediction quality depends on data quality, appropriate model design, validation, and responsible use.

Responsible use

Because delinquency decisions can affect people financially, an AI-supported workflow should consider fairness, explainability, data privacy, human oversight, and the consequences of incorrect predictions. The prediction should therefore be treated as an input to a broader decision process.

Learning gained

This task connects analytical modelling with a concrete business problem. It demonstrates why prediction is valuable only when its output can be translated into an understandable and responsible action.

BUSINESS REPORTING AND DATA STORYTELLING

The certificate lists “Business report and data storytelling for collections strategy” as the third practical area. [filecite\turn0file0\L9-L10](#)

Business reporting

A business report converts analysis into a structured document that communicates the most important findings. Unlike a purely technical notebook, a business report should emphasize the question being answered, the evidence, the meaning of the findings, and the recommended direction.

Data storytelling

Data storytelling combines data, visual communication, and narrative. The aim is to help an audience understand not only what the data says, but why the finding matters and what action may follow.

A strong analytical story can follow this sequence:

- Business question — What decision needs support?
- Evidence — What does the data show?
- Insight — What is the important pattern or risk?
- Implication — Why does the finding matter?
- Action — What should the business consider doing?

Collections strategy context

For collections, storytelling can help decision-makers understand where attention should be concentrated and why. It can connect risk or prediction results with operational priorities.

Key communication principles

- Use simple and meaningful charts.
- Highlight the most important finding rather than every available metric.
- Avoid misleading scales or unnecessary visual complexity.
- Explain technical results in business language.
- Clearly separate observed facts, interpretations, and recommendations.

IMPLEMENTING AN AI-DRIVEN COLLECTIONS STRATEGY

The fourth practical area recorded by the certificate is “Implementing an AI-driven collections strategy.” [filecite\turn0file0\L9-L10]

From analysis to action

Implementation is the stage where analytical findings are converted into a practical operating approach. An AI-driven collections strategy can be understood as a structured process in which data and predictive insights help determine how cases are prioritized and what type of intervention may be appropriate.

Illustrative decision framework

Stage	Purpose
Data preparation	Ensure information is suitable for analysis and use.
Risk assessment	Identify relative levels of collections risk.
Prediction	Estimate likely delinquency or priority.
Segmentation	Group cases according to relevant characteristics.
Action selection	Choose an appropriate collections response.
Monitoring	Track outcomes and improve the process.

Human oversight and monitoring

Implementation should include monitoring of model performance and business outcomes. Human review remains important for sensitive decisions, especially where predictions may be uncertain or where an incorrect decision could have a significant impact.

The overall learning objective is therefore not simply to create a model, but to understand how analysis, communication, strategy, and implementation fit together.

SKILLS, LEARNING OUTCOMES AND CHALLENGES

Technical and analytical skills

- Understanding the role of exploratory data analysis.
- Thinking about risk in a structured, data-driven way.
- Understanding the purpose of AI-based prediction.
- Connecting predictive outputs with business decisions.
- Presenting analytical findings through reports and data stories.

Professional skills

- Problem definition and analytical thinking.
- Clear communication of technical findings.
- Business-oriented interpretation of data.
- Responsible thinking about AI-supported decisions.
- Ability to structure a project from analysis through implementation.

Challenges and how they can be addressed

Challenge	Good practice
Complex or incomplete data	Validate data quality before analysis.
Technical results are difficult to explain	Use simple language and focused visualizations.
Predictions can be wrong	Evaluate models and maintain human oversight.
Business users need actionable findings	Translate insights into clear decisions and priorities.
AI can introduce risks	Consider fairness, privacy, transparency, and monitoring.

Overall learning outcome

The simulation provided a connected view of the analytics lifecycle: understanding data, assessing risk, using AI for prediction, communicating findings, and considering implementation. These activities strengthen the ability to approach data problems from both technical and business perspectives.

CONCLUSION AND REFERENCES

Conclusion

The GenAI Powered Data Analytics Job Simulation was a practical learning experience focused on the connection between data analytics, artificial intelligence, business reporting, and collections strategy. According to the Certificate of Completion, the completed practical areas included exploratory data analysis and risk profiling, predicting delinquency with AI, business reporting and data storytelling for collections strategy, and implementing an AI-driven collections strategy. [filecite\turn0file0\L5-L10]

The experience demonstrates that successful analytics is not limited to building a prediction. It begins with understanding data, continues through risk and predictive analysis, and becomes valuable when insights are communicated clearly and translated into responsible business action.

Future scope

- Develop stronger skills in Python, SQL, statistics, and machine learning.
- Learn model evaluation and explainable AI techniques in greater depth.
- Practice dashboarding and business intelligence tools.
- Study responsible AI, privacy, fairness, and model governance.
- Build end-to-end analytics projects using real-world datasets.
